Avian Osteology, B. Miles Gilbert, Howard G. Savage, Larry Martin. This book does apparently have a key guide in addition to comparative resources and a walk through of sexual dimorphism in turkey skeletons, but from what I can tell is severely limited. It is focused on North America, and seems to primarily focus on landfowl.

Birds and mammals are the two groups of large-brained, endothermic ("warm-blooded") animals on Earth. In this lab you'll compare bird and mammal skeletons, and you'll see some clear homologies between these two groups. This shouldn't be too surprising, since both birds and mammals are descended from the same early vertebrate ancestors.

1. Introduction. Uncinate processes extend from the caudal edge of the vertebral ribs. In modern birds (with the exception of the Sphenisciformes and Apteryx), the processes are ossified to the thoracic ribs and typically have a bell-shaped base and taper distally (figure 1 a-c).Avian uncinate processes were originally interpreted as having a primary function in stiffening the rib cage and ...
